## Covering for a display device

### Abstract

AI For the covering of a display device,

- the covering being translucent, at least in some areas,
- the covering at least partly covering the front side of the display device,
- the covering shielding electromagnetic fields,

it is proposed to configure it in such a way that

- a) either the covering is made of an intrinsically electrically conductive polymeric material or contains such a material and the covering has a means of making electrical contact
- b) or that a thin, intrinsically electrically conductive polymer layer that is translucent, at least in some areas, is applied to the covering, and the polymer layer has a means of making electrical contact.
